

Project Title

Tour Guide Hub – Integrated Tourism & Freelance Guide Marketplace (Egypt)

2. Project Overview

• Objective:

The main objective of this project is to develop an integrated tourism web platform focused initially on Egypt, that connects tourists with verified freelance tour guides while also providing complete travel services such as tour booking, restaurant discovery, river trips, and curated “Things to Do” recommendations.

The platform aims to:

- Empower freelance tourist guides to find job opportunities independently.
 - Provide tourists with a trusted, all-in-one digital tourism solution.
 - Digitally organize tourism information about Egyptian destinations.
-

• Scope of Work:

The system will include the following core modules:

1. Freelance Guide Marketplace

- Guides create professional profiles.
- Tourists can search, filter, compare, and book guides.
- Guides may offer private tours or trips.

2. Tour Booking System

- Platform-organized tours (multi-day, overnight, city tours).
- Guide-created tours.
- Tourists can directly book available tours.
- Revenue generated from tour booking payments.

3. Hotel & Restaurant Listings

- Browse hotels and restaurants in selected cities.

- View ratings, descriptions, and recommendations.
- Display suggested activities near each location.

4. Things To Do Module

- Tourists select a destination
- System displays recommended activities.
- Organized by season (Winter / Summer).

5. Destination Information System

- Detailed information about cities.
- Historical and cultural descriptions of landmarks.
- Best time to visit (by season and month).
- Highlighted attractions (example: major landmarks in a city).

However, our system focuses specifically on Egypt and integrates freelance guide hiring more directly.

• Expected Outcomes:

- A fully functional full-stack tourism web application.
- A secure role-based authentication system (Tourist / Guide / Admin).
- Working booking logic for guides and tours.
- Tour and activity recommendation engine based on location.
- A scalable backend architecture.
- A monetization model through:
 - Guide booking commissions.
 - Tour sales.
 - Potential hotel partnerships.

3. Problem Statement

Although many global tourism platforms exist, several gaps remain in the local Egyptian market:

- Freelance guides lack a dedicated marketplace to promote their services independently.
 - Tourists struggle to verify guide credibility.
 - Tourism information about Egyptian cities is often fragmented across platforms.
 - There is no single local platform that integrates:
 - Guide hiring
 - Tour booking
 - Hotel browsing
 - Restaurant recommendations
 - Seasonal travel guide
 - Things to do suggestions
-

4. Proposed Solution

The proposed system is a full-stack tourism platform that operates initially within Egypt and provides:

- Direct booking of freelance guides.
- Option to join pre-organized tours.
- Booking overnight or multi-day tours.
- Destination-based recommendations.
- “Things to do” categorized by activity type.
- Seasonal and monthly travel guides.
- Hotel and restaurant discovery features.
- Informational pages about attractions and landmarks.

Revenue is generated directly from tourist payments when booking guides or tours.

• Technologies Used:

Frontend:

- React.js
- Responsive UI Design
- Axios for API communication

Backend:

- Node.js
- Express.js

Database:

Authentication

• System Architecture:

The system will follow a three-tier architecture:

1. Presentation Layer (React Frontend)
2. Application Layer (Node.js + Express API)
3. Data Layer (MongoDB Database)

Core system components:

- User Authentication & Role Management
- Booking Engine
- Availability & Calendar Logic
- Review & Rating System
- Commission Calculation Module
- Destination & Activity Recommendation Module

The architecture is designed to be scalable and suitable for future expansion into other countries.

5. Resources Needed

• Hardware/Software:

Hardware:

- Development of laptops
- Internet access
- Testing devices (mobile & desktop)

Software:

- Visual Studio Code
- Node.js runtime
- MongoDB
- Git & GitHub
- Postman (API testing)
- Figma (UI/UX Design)
- Hosting platform (cloud deployment service)

Project Team Members:

1-Tasneem Ahmed Mohamed.

2-Nermeen Safwat Nassrallah.

3-Eman Mahmoud Ebraheem.

4-Shahd Essam Saad Hassan

5-Nada Essam Hassan Mahmoud
